Company Profile

You can find more information about the annual report by 3M 2021

3M (Minnesota Mining and Manufacturing) is a technology company that operates through four business segments: Safety and Industrial, Transportation and Electronics, Health Care, and Consumer. The Safety and Industrial segment specializes in personal safety, industrial adhesives and tapes, abrasives, closure and masking systems, electrical markets, automotive aftermarket, and roofing granules. The Transportation and Electronics segment is focused on electronics (display materials and systems, electronic materials solutions), automotive and aerospace, commercial solutions, advanced materials, and transportation safety. The Health Care segment offers medical and surgical supplies, skin health and infection prevention products, oral care solutions, separation and purification sciences, health information systems, inhalation and transdermal drug delivery systems, and food safety products. The Consumer segment includes office supplies, stationery, home improvement products, home care products, protective material products, certain consumer retail personal safety products, and consumer health care products.

3M was founded in 1902 and initially focused on the extraction and processing of minerals for the production of sandpaper for the automotive industry. Due to customer requirements, the company has gradually expanded its product range. For example, researchers of the company have developed the first masking tape for the two-color painting of then fashionable cars. On this basis, the company quickly began to diversify and expand internationally.

Today, more than 60,000 3M products are used in homes, businesses, schools, hospitals and other industries. One third of our sales come from products invented within the past five years, thanks to innovations from the thousands of researchers and scientists we employ around the world.

With corporate operations in 70 countries and sales in 200, we are committed to creating the technology and products that advance every company, enhance every home and improve every life.

Work Objectives

As a working student, I have the following responsibilities:

- support of a defined group of customers in the office (EMEA Region)
- pro-active, sales-oriented conversation with customers
- optimal order processing (increasing the automatic order flow)
- close cooperation with sales and marketing functions
- close cooperation with the plants and the supply chain planning organization
- coordination of logistical requirements of customers (transport, packaging, customizing)
- data maintenance in relevant systems
- handling of the entire order, complaint, returns, and complaint processing within the agreed objectives

To be able to archive these different objectives and get a complete overview of the different tasks of all internal contact persons as well as the interactions between all the adjacent functional areas, an onboarding plan has been planned for this purpose.

*here you can find more
information about my
onboarding plan*

To be able to achieve these objectives, I had to integrate first with the 3M organization and its philosophy, - worldwide, within Central Europe Region. I also received important information on general topics such as workplace safety, medical care, and other important social services at 3M. Then I had to use different work tools such as SAP, Microsoft teams, Microsoft office, Share Point, Salesforce, and other tools used internally. These different tools were presented to me by my various collaborators. In parallel, I took part in the different sessions of Onboarding.

During the first week of training, feedback interviews should be conducted as daily as possible at the end of the day, at least once a week from the second week of training.

Work Training

ERP OVERVIEW

ERP OVERVIEW

What the supplier wants is order and obviously wants to ship it to their customers and send them an invoice and then wants to get paid. Mostly, the process starts with a sales quotation before the supplier get the payment. That is a major process in business. The name of this process is the **Order-to-Cash process**. An another business the **procure-to-pay (P2P)** is just a mirror image of the Order-to-Cash.

The customer must be available to receive the order and the supplier sends the invoice and the customer buy. Sometimes the customer can ask for a quotation before the supplier issue a purchase order. There is one other way for a purchase order to arise some businesses allow their people. The business keeps a lot of data as well as customers products, pricing and suppliers. To connect a business, we can use two ways:

Via Inventory that the customers keep in our businesss when we receive something from a supplier, we put it into inventory, when we ship it to a customer, you take it out of our inventory

Via finance: The general ledger is used for financial accounting and management accounting. When you think for the financial accounting, think of the financial statement that you get every month.

ERP is the major process that optimize the flow of information materials in cash in our organization. If we have a production order, sale order ,and purchase order which are demand signals. A demand signal information flows upstream from the customers to the suppliers and an ERP system are designed to optimize this flow of information. The material can be bought, manufactured ,and sold. Materials flow downstream from suppliers to the customers.

Finally, **cash invoices and payments** can flow into and out of our business with records of everything flowing into the general ledger. The material has to be in inventory before we can start with the production. Otherwise, we will not be able to make our product.

We have to figure out the production orders to give to the plant taking into account all the demand from our customers, all the supply from existing production order in existing purchase orders and all existing inventoried materials, work-in-progress and finished goods, while spending the minimum of amount of our limited cash.

How should we figure this out ?

The ERP system is very important and provides some kind of planning capability. It is right in the name of enterprise resource planning. Those ERPs grow out of and is still used in older capability planning called MRP(Materials requirements planning) later known as manufacturing resource planning. The ERP grow out of and still use in older capability planning called(Materials Ressource Programming) later know as manufacturing ressource planning. For now, we are just going to call it planning. The planning system looks at customers and sometimes the forecast from the sale departments to figure out the total demand for each of our products on a daily basis from today until several weeks into the future then it will look at each products bill of materials to see what materials are required and then it will check how much inventory we have. If we don't have enough materials to make those finished goods to meet the demand, the planning system spring into action. The planning knows where we pay, so we can always automatically raise a requisition or a purchase order to tell the plants to manufacture the finished goods. We need to meet our

customers'requirements.

In simplest terms, the planning system optimizes the purchase and the production. We don't have to figure it out by ourselves. An ERP system can do this far more efficiently than we could ever mainly do it by ourselves.

ERP actively helps you manage our two biggest costs: purchasing and production while spending the least possible. Whenever we bought or sell something, we generate financial records to wind up in a general ledger. Most parts of your business feed information into the general ledger eventually. There are also specialized areas in finance for example accounts receivable which manage the important tasks of sending information to customers and getting paid. There is a mirror image area on the procurement side called account payable which accepts supplies invoices and pays them. There is another area of the business that feeds the financial aspects of all our activities into our general ledger.

ERP OVERVIEW

What is an ERP?

ERP is a distribution business. If we want the ERP to support manufacturing, we also need a product for producing. We must use a production order to define what to make and when to make it. We have to start by taking materials, they need out of inventory. This is called a material issue because the materials are issued from an inventory for a production order. Once the production execution process is complete, the finished goods would be back into inventory. Just like in sales and procurement, the production team will keep records of important master data. The most important records are the bill of materials and the routing which tell the team everything they need to know to produce finished goods. Manufacturing is like baking a cake. We need to know the ingredients and we need to know these instructions. **The bill of materials** is just a list of materials you need to make a finished good, exactly like a ingredients list. **The routing** is the sequence of steps that you perform to transform the materials into the finished products. Every manufacturer in the world use always these simple records to set up and run **the production process**.

The manufacturing planning challenge

we have to figure out which products to make, how many, and when, specifically when to have them ready in inventory so we can ship them to our customers then we have to figure out which materials we need to make these products specifically how many of each, where we have to buy them from and when to have all them already in inventory so we can issue them to production. This gets a little tricky because each finished product could have dozens of parts.

Inventory strategies

Every business runs on cash, and starts with a very basic truth. Cash is oxygen, if we don't have cash, we can not pay our suppliers, our lenders, and our employees, and every-

thing we do comes to an abrupt stop. We have to invest some of our precious cash in inventory. It is important to keep the materials to use in production and the finished goods but the key here is an inventory. If we manage good our inventory, we will get a great return.

For an inventory strategy, we have to balance two opposing forces:

- **Underinvest in inventory**(in this way our customer service will suffer, and our customers will buy in another business)
- **Overinvest in inventory** but we can run out of cash and again you will go out of this business. What we need is enough inventory to satisfy customer's demand and absolutely no more finished goods than necessary.

A lead time is a major contributor to customer service. We have to invest a lot of cash to support this. We make our customers wait a long time when we can not invest in inventory.

The most popular strategies in inventory are:

- **Market-to-stock** means we maintain an inventory of finished goods ready to sell when customers call for them. You can meet the demand instantly but we have to support a lot of cash to support this cash invested in risk;

Make-to-order: we have to wait for the demand of customers before manufacturing the goods.

Assemble-to-order: we keep some semi-finished items in inventory and then when the customer places an order, we finished them and deliver them. We are trying to offer shorter lead times without committing too much cash to inventory.

Configure-to-order: The customer can only choose a pre-

defined set of options. We would get an inventory of nearly finished products that we can finish and ship very quickly

Engineer-to-order: When no one has what the customers want. The final product will be a unique product that meets the customer's requirements.

The ERP helps to support the strategy that we have chosen the run our business. The plant engineers calculate the optimum inventory level for our business.

SAP OVERVIEW

SAP, pronounced "S-A-P", is the business Enterprise Resource Planning (ERP) system that 3M selected to manage many business tasks. Fiori is a user experience developed by SAP to enhance and simplify the user experience (UX).

SAP Modules

SAP integrates multiple business processes and functions into one comprehensive system. It consists of individual applications called application modules. Application modules can be accessed using the standard SAP graphical user interface (GUI) or the web-based Fiori Home Page, also known as the Launchpad.

What is SAP Fiori?

SAP Fiori provides access to compatible smartphones and tablets. It enables multiple device applications. Start a process on one device and continue on another seamlessly. Fiori access and functions are assigned based on SAP Business Roles.

It can replace more complex and laborious transactions in SAP Graphical user interface(SAP GUI).

SAP Data Types

There are two main types of data in SAP:

- _ **Master data** which serves as an input to day-to-day business tasks in SAP. It requires creation and maintenance to be tightly governed.
- _ **Transactional data** are created through day-to-day business tasks in SAP and Fiori. It is created and maintained in real time as users perform transactions.(sale order, purchase order, production order, invoice).

INTERCOMPAGNY OVERVIEW

Why intercompany?

Intercompany as it relates to 3M business as a whole*:

- 3M Total Sales: \$35.3 billion -Enabled by:
 - \$12.6 billion in Intercompany transactions (contract price)
 - 3 million invoice transactions requiring reconciliation and netting
 - 108,570 potential selling and purchasing combinations
 - Compliance with export and import requirements (3M ships to 140 countries)
 - Over 750 Legacy systems and 1 million lines of code
 - Processes, resources, and systems in place to ensure all regulatory and legal requirements are met

At 3M, materials move between plants belonging to the same or different legal entities (Company Codes in SAP). The movement of these materials between the same legal entity is defined as **Intracompany transfers**. Transactions between different legal entities are defined as **Intercompany transfers**.

- **Intracompany**: The receiving and supplying plants are defined organizationally within the same legal entity or Company Code.

- **Intercompany**: The receiving and supplying plants are defined organizationally as part of different legal entities or Company Codes.

Indirect Goods and services

In addition to materials, indirect goods and services are also exchanged between two legal entities. Examples include:

- Transfer of capital equipment from a 3M Source of Supply (SOS) plant to a 3M Purchasing Subsidiary (PUSB) plant
- Purchase of a prototype material from another 3M SOS
- Non-trade activities, such as foreign services
- Tooling and Repair activities
- Shipment of awards from 3M US to a Subsidiary
- Non-trade activities, such as foreign services

Stock Transport Order

A Stock Transport Order is a firm, executable order to move material between two SAP plant locations.

- An STO document is created and visible to both the purchasing plant (receiving plant) and Source of Supply plant (supplying plant) based on the requirements plan.
- The Source of Supply plant creates Outbound Deliver (OBD) against the STO and ships the material

Cross- company sale order

- **Intercompany single flash shipment**: Product is sent directly from European M&SCS (Manufacturing and Supply Chain Services) Distribution Center to the end customer. System transactions flash through the selling affiliate.
- **Intercompany double flash shipment**: Product is sent directly from the manufacturing plant to the end customer.

INTERCOMPANY OVERVIEW

ORGANIZATIONAL STRUCTURE

Organization structure

- Country Marketing and Sales Organization: Legal entity that takes a customer's order; sometimes referred to as a PUBS.
- Source of Supply: Location that physically ships product to a customer; typical SOSs are Manufacturing Plants, Supply Chain Warehouses, European Distribution Centers (EDCs), Local Distribution Centers (LDCs), Subcontractors, and Repair Centers.
- Manufacturing and Supply Chain Services: A legal entity that manages the supply chain of an entire region; the M&SCS is responsible for how much product is produced, where it is stored, and defines which locations ship to which customer; CMSOs cannot change the Ship from on a Sales Order without the permission of the M&SCS; EMEA M&SCS is the legal entity that manages the European region.

In 2015, 3M set a cumulative goal across all diversity categories to double the pipeline of diverse talent in management globally from 32.6% to 65.2%. By 3M the progress of advancing representation of Black/African American and Hispanic/Latino individuals from entry-level to senior management in the U.S. workforce is measured by the global Diversity Index:

ORDER-TO-CASH PROCESS OVERVIEW

The OTC process starts with Order Management and ends with invoicing by the AR department.

ORDER-TO-CASH PROCESS OVERVIEW

The Order Management process is the first processing stage for a business transaction in Sales and Distribution (SD). Order Management allows you to perform different business transactions based on the sales documents defined in the system. SAP controls how a sales order received from the customer is processed, including checking the information on the Customer's order and applying **Incompletions or Delivery Blocks** based on defined rules. Operational reports such as the CSR Worklist and Order Status reports allow real-time visibility to data in a format that is easy to work with.

Order fulfillment starts when the order has been saved and ends when the delivery is created. Subprocesses performed as part of the Order Fulfillment process are: **Rescheduling**, **Available to Promise (ATP)**, **Output (ASN and packing lists)**, **Automotive/Order Scheduling**, **VMI**, and **Consignment**.

Billing is the final processing stage for a business transaction in Sales and Distribution (SD). Information on billing is available at every stage of order and delivery processing. The billing process helps create and manage billing documents and communicate them to the customer in the customer's preferred methods.

The OTC process begins with Order Management and sales order processing in SAP or SAP CRM. After LEX fulfillment processes, OTC processing continues with invoicing, collections and post-sales repair

services. Benefits of the Collections process include automated and formalized workflow, global formats, reduction of exceptions and errors, complaints and disputes, and improvement of customer satisfaction while reducing costs.

Organizational Units

- Sales Organization**: The highest organizational unit that sells materials or services from one or more plants within one or more legal entities.
- **Distribution Channel**: A channel that represents an abstract and logical grouping of 3M customers. Each business transaction in sales is linked to a distribution channel. 3M has two distribution channels - 00 for standard and 10 for Intercompany.
- **Division**: An organizational unit that establishes responsibility for profits from materials and services. It is used to organize materials or services,
- Sales Area**: A combination of a sales organization, distribution channel, and division. It is a logical concept in SAP. All customer data relevant for sales is defined according to the sales area.
- Sales District**: A group of related 3M direct sell customers with similar go to market strategies, supported by a specific group of sales representatives.

Standard Sales Order – Scenarios

- Standard Inventory Items**: This is a commonly used scenario in sales orders. Material is stocked in a distribution center.
- Manual Allocation Items**: In a special situation, such as a serious supply constraint, the inventory allocation may be done manually instead of following the standard Avail-

able-to-Promise (ATP) method.

-**Free Goods Process** gives some products free of charge to its customers if they order a certain quantity or as a promotion.

-**Purchase-to-Order**: A product that 3M purchases from an outside vendor and supplies to a 3M customer on demand. Product can be sent to 3M to be received. Then the product can be shipped to the customer or the vendor can drop-ship directly to the customer.

-**Make-to-Order**: A product that is custom manufactured for a specific 3M customer order.

-**Sales Bill of Materials (BOM)**: represents a finished product which is assembled from different components. Both the finished product and the components appear as separate items in the sales order document.

Standard Sales Order Creation – Process Steps

ORDER-TO-CASH PROCESS OVERVIEW

Blocking Documents

Sales, delivery, or billing documents can be blocked for certain customers or orders.

The following blocks are used during sales order processing and can be set up in the Customer Master records.

1. To prevent an order from being created for a customer: set an Order Block on the Sold-to customer.
 2. To prevent an order from being dropped for delivery and shipped: set a Delivery Block on either the Sold-to or Ship-to customer.
 3. To prevent an order from being billed: set a Billing Block on either the Sold-to or Bill-to and Payer customer.
- Note: orders will still ship to customer.
- Blocks can be set up in the customer master, triggered by incomplete data, or set by the system or the CSR on the order.

A delivery block is also set by the system if an EDI order contains:

- Any special instructions from the customer.
- An invalid material or an invalid Unit of Measure (UOM).
- An order line that has any violation of the minimum quantity or improper increments. This value is maintained at the Sales Area level. The check will be activated per the Sales Order type.
- Dangerous goods check: if the material has a dangerous goods profile, this check will be performed.
- Global Trade Service (GTS) checks will be performed when for orders exporting goods/services out of the USA.

The reason codes for delivery blocks used in SAP are:

When the sales order is blocked for billing, SAP prevents the billing document from being created until the block is removed. Note: this does not prevent the order from being shipped. A billing sales block is set at the header level and for the individual items as well. It can also be set at just the item level. It is recommended that whenever a billing block is used, header or item level CSR Note Text be added stating the reason for the billing block.

Consignment Pick Up

Some of the reasons why material is sent back from the consignment stock to the 3M main location:

- The customer has excess stock.
- anymore.
- The material is damaged or expired.
- 3M needs the material for another customer.
- Demo, exhibition, or trial have been performed.

Types of Notifications:

- **Customer Complaint** used only for simple logistics complaints at the present time at 3M. Customer complaint is to be handled in CFR until replacement system is available.
- **Complaint Against Vendor**: Future use at 3M. ISM System is to be used until replacement is

supported.

- **Internal Problem Notification** : Used for management of non-conforming product.
- **Batch Recall Notification** specifically to support recall procedures.
- **Corrective and Preventive Action** : Used to implement CAPA processes.
- **Business Process Quality Notification**:Used to support notifications for issues with business processes and procedures not related to a material.
- **Restricted Quality Notification**: Used to support restricted access to a notification that may include sensitive information.
- **Scrap Notification** Used for simple management of material to be scrapped and allows documentation to be captured with regard to the scrapping decision.

ORDER-TO-CASH PROCESS OVERVIEW

Text Determination

Text is designed to manage the flow of text type notes into Sales and Distribution (SD) documents and downstream.

The key benefits of text determination are that:

- It supports the exchange of information between the business partners through texts in Master Records and documents.
- Texts can be defined or maintained manually for a particular customer.
- Texts can be manually added to an SD document during document creation.

It is possible to store texts related to carrier preferences in a customer's Sold-to and Ship-to tables, but not in their Payer or Bill-to tables.

Also, customer specific or product specific instructions or both can be given to the warehouse.

For example, it is possible to specify:

- A special kind of picking, packing, and shipping for an order.
- Manufacturing instructions to describe the configurable part of a material, such as dimensions and dimension tolerance, if any.

In SAP, texts are entered for the various document types at the header and line level.

At Header Level

At Line Level

Text Determination Instructions

- **Manufacturing Instructions:** Text IDs are used to communicate information to the manufacturing plant. Texts may include requests for special testing of product.
- **Warehouse Instructions:** Text ID stores information to be transmitted to the warehouse. It may include batch Information and customer specific handling instructions.
- **Packing Instructions:** Text type note that stores the additional information necessary to package the order or to deliver correctly.
- **Billing Instructions:** Text which explains the process to bill the customer, including the information that needs to be attached to the invoice, credit note, and debit note.
- **Shipment Instructions:** Text type note which stores instructions intended for shippers that must be printed on the associated shipment documents (Bill of Lading texts, and so on).
- **Carrier Instructions:** Text type note which includes instructions intended for the carrier of the associated shipment, such as special delivery agreements or handling requirements (For example, type of truck required for pickup)
- **Customs Instructions:** Text type note which stores any information that needs to be passed on to customs.

Material Listings overview

Material Listings are used to control the materials that 3M customers are allowed to purchase. The Material Listing procedure in SAP contains the Listing Condition Types that are applied to a sales document. When sales documents are processed in SAP, the Listing

determination functionality is executed to regulate the materials that are permitted in the sales document.

Triggering Order Confirmation

The output monitor on the sales order screen indicates the overall status of the order confirmation.

Commercial Packing List

The Commercial Packing list is created from the pro forma invoice.

Determination for Billing Documents

The prerequisites for Output Determination of billing documents are:

- Output condition records are defined
- Billing document is posted to Accounting in SAP

PRICING OVERVIEW

Pricing

The pricing procedure contains the logic of how pricing is applied to the order. There are multiple pricing procedures due to tax requirements. For customer orders, the order type of ZOR is used. There are other types of orders, such as ZFD used for sample orders. The pricing procedure contains the logic (configured algorithm) to determine how to price a sales document.

The pricing process is triggered when you need to set or change a price, adjustment, or discount. Examples of when this occurs:

- Launch of a new material
- Material costs require a price increase
- Competition pressure drives a price decrease
- Planning a promotion
- Price negotiations with customers
- Currency devaluation
- Go-to-market strategy change

Standard Price Procedure

The price applied to a material on an order is determined by the standard Pricing Procedure in SAP. The slides that follow are a review of several different example scenarios:

1. Country List Price (CLP)
2. Country List Price with Mixed Pallet and Promo Code Discounts (CLP + Mixed PAL and Promo Code)
3. Country List Price with Promotional Exclusive Discount (CLP + Promo EX)
4. Customer Specific Price (CSP)
5. Customer Specific Price with Promotional Exclusive Discount (CSP + Promo EX)
6. Deal Price
7. Manual Price

All standard order and promotion discounts apply to the country list price.

Note no Promo Ex Discount. No Mixed Pallet Discount. No Promo Code Discount.

Price Determination		Active Status		Price Guidance		Minimum Standard Price	
						Price Floor	
						Price Corridor (LPCT, LPCT)	
Country List Price							
Promotion Exclusive Discount		None					
Deal Price		None					
Customer Specific Price		None

	Price before Promotions					Promotional Discounts = -1.000%				
	Promotional Discount (%)									
ON INVOICE	Promo Code Discount (%)					Gross Invoice Price				
	Price (net)									

*Note: Market Adjustment Amount overrides Market Adjustment %

Key Standard Pricing Elements

- Country List Price: starting price in the global price waterfall Price
- Market Adjustment:
- Adjustment from Country :List Price for a Sales District
- Adjustment Customer Specific: Price Price for a specific customer at or above Minimum Standard Price
- Price Customer Specific Discount : Discounts based on specific customers at or above Minimum Standard Price
- Channel Discount: based on the customer channel dis-

count

-Tier Discount :Dis-

counts based on the customer tier

-Quantity Discount: Scale discounts based on quantity of material purchased

-Quantity Assortment Discount: Scale discounts based on mix of material purchased

-Value Assortment Discount: Discounts based on total value of material purchased

-Promotional Discount: Typically, short term discounts given to customers for purchasing specific materials

-Promo Code Discount: Short term discount given to customers who provide an active promo code at the time of order

-Pallet Discount: Discount based on orders that contain full pallet quantities of materials

PRICING

Customer Order Pricing Process

Customer Order Pricing process:

Pricing Elements of a Customer Order Overview

Some key items on the header details screen that impact pricing are:

- Sold-to party
- Pricing Date
- Sales District
- Pricing Contract
- Pricing Groups

Default unit price decimal precision is four (4) decimals.

However, if needed, a business can decide to set a different precision. For example, some Consumer customers require two decimal unit prices.

Sold-to and pricing date details are described here:

Under the Conditions tab, the color, and symbol next to a price condition indicates the status of the condition and the manner in which it was applied to the order.

Inactive Condition means that the condition has not been applied to the order.

Active Condition means that the condition was applied to the order.

Incorrect Condition means that the condition is incomplete and has not been applied to the order.

N..	CnTy	Name
⚠	ZR01	Country Price
✅	ZR05	Cust Specific Price
		Gross Price
❌	ZA01	Market Adjustment %
		Market adjusted Pric
		Price Sub Total
		Price (net)

PRICING

Quantity discounts are based on how much quantity of a single material was ordered.

They can be used when high volumes of the same material are purchased.

Assortment discounts reward customers for purchasing a high volume of a mix of materials.

The types of assortment discounts available are:

Quantity Assortment Discount	Discount based on the quantity of a group of materials purchased. For example, customer purchased 1,000 of each.
Value Assortment Discount	Discount based on the value of a group of materials purchased. For example, customer purchased \$10,000 worth of the material.

Pricing Within the Nine Integrated

Processes Pricing is a subprocess of **Marketing to Order (MTO)**.

- MTO is one of the nine integrated processes in 3M.
- MTO is part of Customer Facing.
- Customer Facing is also comprised of the Order to Cash (OTC) and Customer Relationship Management (CRM) processes.

Subprocesses of Pricing are :

PRICING

Tools in Pricing

Role in Pricing

Price Approver : reviews and approves or denies prices, adjustments, and discounts in Price Manager and Deal Manager.

Workflow Maintainer: Creates and maintains workflow levels, thresholds and approvers for both Price Manager and Deal Manager and can view all Price Manager workbooks and policy tables

Business Services: The Full Service role has the ability to create, maintain and submit in both Deal Manager and Price Manager within assigned Sales Organizations. The View Only role has the ability to view in both Deal Manager and Price Manager within assigned Sales Organizations. In Profit Analyzer, both have the ability to analyze transactional data, identify pricing opportunities, and monitor performance within assigned Pricing Region(s) and Sales Organizations

Price Setting and Tools

Deal Request Types

PRICING

Performance Based

- Special prices to provide incentives to drive customer behavior
- Drive distributors to push 3M materials over competitive materials

Hold Price

- Deviations on price to hold from a previous price period or to keep a current price with protection from future price increases
- Need to hold price for a customer to retain customer preference

Deal Promotion

- Deviated promotional price for a short period of time

Price Execution Process

We strive to use technology and expertise to promote a future where resources are circulated, and nature is regenerated

Together, we will lead and design an equitable and sustainable future for all

ATP Und Inventory Management Tools

Inventory Allocation Process Order

1. Planners maintain Supply Information (for example, Purchase Orders, Production Orders, Material Lead-times)
2. Sales Document gets created (may be automatic or manual); SAP automatically "soft" allocates inventory
3. Optionally, Planners may manually reallocate inventory
4. The system will create Deliveries; SAP automatically "hard" allocates inventory
5. Goods are picked, packed, and shipped to customer
6. Invoice is generated and sent to customer

Available-To-Promise Overview

ATP is SAP's automated process to determine the "promise date" of a Sales Order, considering both current inventory availability and replenishment plans in providing a date as close as possible to the customer's requested date.

Characteristics of ATP

ATP takes into account inflows and outflows of inventory when confirming material to a customer Sales Order. ATP preserves on-hand inventory for orders arriving with earlier ship needs.

ATP Dating

When placing orders, customers can provide a date they would like the goods delivered. SAP maps this to the Standard SAP Field: Requested Delivery Date. Not all customers will provide a delivery date. In this case, SAP is configured to set a date and run ATP against it, to calculate when the goods are available.

Backward Scheduling

Backward Scheduling is always performed. If the Customer's Requested Date can be met, these are the dates retained. If the date is not feasible, SAP will Forward Schedule.

Forward Scheduling

Forward Scheduling is performed when the Customer's Requested Delivery Date cannot be met.

ATP Und Inventory Management Tools

Pick/Pack Time

Pick/Pack Times are maintained in the following ways:

Shipping Points: used in Taiwan, Russia, Indonesia, the Philippines, and US. Most Common Pick/Pack Time Per Country:

Country	Pick/Pack Time
Taiwan	4 hours
Russia	1 day
Indonesia	1 day
Philippines	4 hours
US	57 hours

Sophisticated Process: Routes used in Canada, COE, Denmark, Norway, Sweden, Finland, and Turkey. Most Common Pick/Pack Times Per Country:

Country	Pick/Pack Time
Canada	3 days
COE DCs	3 days
Finland	1 day
Sweden	2 or 3 days
Turkey	2 days

Loading Times are maintained in the same way as Pick/Pack Time, however it is nearly always zero days/hours. Notable exceptions are for certain export shipping points that give time for processes like loading on a ship

Transportation Time & Delivery Appointments

Select customers require that the supplier obtain an appointment to receive the goods they ordered. Customers will have alternative routes determined which will contain a longer Transportation Time so we have time to accommodate the delivery appointment requirement.

ATP Overview

FIFO (First-In First-Out) is typically used when processing customers' orders. Any customers who have different dates by plant can have unloading points setup at plant level.

Plant and Route Calendar

The Factory Calendar that is stored in the Source Location (Plant) should align with the dates that the Plant operates and is considered within the ATP calculation. If a holiday falls between the Material Availability and Loading Date, an extra day is added for each holiday on the Factory Calendar. This would be the same scenario for Routes in relation to the Factory Calendar that is stored in the Route. Calendars require continued maintenance; current Factory Calendars are maintained for approximately 3 years in advance.

Production Strategy and Impact on Dating

Each material in SAP is assigned to 1 and only 1 of the following Production Strategies:

- **Make-to-Stock (MTS)**
- **Make-to-Order (MTO)**

Many Polaris Team Members refer to this as "hard-linked" inventory since the Sales Order is directly linked to the supply element

Non-Stock

Many Polaris Team Members refer to this as a Make-to-Stock Out-of-Stock scenario

Rescheduling

Rescheduling is SAP's tool to update the dates on Sales Documents.

Polaris has designed rescheduling to perform the following:

- Maintain FIFO (First-in/First-out) priority of Sales Orders
- Update Sales Order dates (Material availability date, transportation planning date, loading date, expected goods issue (GI) date, and so forth) based on the most current information available from related documents such as Purchase orders, process orders, and so forth

Polaris Tools to Manage Inventory

These tools are used to manage inventory:

- Manual Allocation
- Material Reservation
- Product Allocation
- Advance Booking
- Backorder Processing
- Rescheduling with Delivery Priority

ATP Und Inventory Management Tools

Partial Delivery

SAP provides the following standard functionality:

- Complete Delivery Required for a Sales Order will push out the entire Sales Order to the last confirmed line
- Partial Delivery Per Item indicates if a line can have partial deliveries or if the line needs to be delivered complete
- Delivery Tolerance determines if a line can accept more or less than requested
- For example, under tolerance is 20%, if 8 Cases deliver out of 10 then SAP will close the line

Automatic Cancellation of Backorders

It is a common business requirement for customers to request that we ship to them only once. If we cannot fulfill their complete order in one shipment, we would like to prevent any other goods on that order from shipping to the customer

Freights Management

Freight Activities Overview

Sales District can be used to drive Pricing, Freight Terms, Responsible Customer Service Representative (CSR) code, and so forth. Freight charges are driven by customer and Sales District combination; shipping conditions, as well as customer master, are used to drive freight charges.

Freight Charge Back Orders

When an order is shipped to a customer, freight costs from the shipment may be charged back to the customer on the invoice, depending on business rules. The freight charge back indicator identifies which orders require freight costs to be applied to the invoice.

Incoterms

Incoterms are identified as follows:

- Incoterms is the International Commercial Terms Code.
- Incoterms is defaulted from Customer and Sales District, or pricing condition (if applicable).
- Incoterms may also be manually updated in the sales document at the header level.
- If a customer order has more than one incoterm, multiple deliveries are created.
- Incoterms can be used to drive freight charges (pricing conditions)

CFR	Cost and Freight
CIF	Cost, Insurance, and Freight
CIP	Carriage and Insurance Paid To
CPT	Carriage Paid To
DAF	Delivered At Frontier - Obsolete
DAP	Delivered at Place
DAT	Delivered at Terminal
DDP	Delivered Duty Paid

DDU	Delivered Duty Unpaid - Obsolete
DEQ	Delivered Ex Quay - Obsolete
DES	Delivered Ex Ship - Obsolete
EXW	Ex Works
FAS	Free Alongside Ship
FCA	Free Carrier
FOB	Free On Board

Additionally, we can override (change) the default Incoterms on the Sales Order. Incoterms are the terms of delivery (description) to the customer, and specify when the freight (product) changes ownership.

Expedite Freight

The Order Expedite process is used when a customer requests goods to be delivered:

- On a date, which requires an immediate shipment.
- By a specific transportation method.

and only affects the distribution fulfillment. This process does not work to expedite the manufacturing process or inventory replenishment.

The Order Expedite process can be used with any order type

Billing Management

The billing management process

The **Manage Billing process** starts with the requirement to generate a billing document and ends with the communication of the invoice to the customer and its posting in the Financial Accounting System.

- The requirement to generate an invoice is usually (but not always) triggered via a confirmation of shipment Post Good Issue (PGI) for a delivery related billing and a sales order for order related billing.

The features of the Manage Billing process are:

- The invoicing process initiates the creation of a billing document, which is used to create the customer invoice, and an accounting document, which is used to transfer data to the Financial Accounting System.
- Invoicing also represents the final processing stage for a business transaction in Sales and Distribution (SD).

The features of the Create Billing Document and Invoice subprocess are:

- Deliveries become due for billing after PGI and upon the billing date being reached.
- Order relevant billings like credit and debit memos are due for billing the same day they are created.
- Creating invoices is usually handled as a batch process for ease of management. All documents which are available for billing in the worklist for invoice creation get picked up in the background job for billing based on the planned billing date.

Some existing batch processing exceptions are:

- **Taiwan:** Due to data requirements for the commercial invoice and the requirement for the invoice to travel with the goods, most invoices in Taiwan are created immediately at the time of shipment completion in the warehouse.
- **Delayed invoicing:** In some cases, due to errors or blocks, invoices may not post to accounting immediately.
- **Cross Company sales:** Some scenarios require billing to be held until goods cross borders
- **Proforma invoicing:** Some customers may require a proforma invoice. Proforma invoices can be generated based on sales orders or deliveries. The data of a proforma and a regular invoice are similar. Proforma invoices do not post to accounting and are meant only for information purposes to the customer. Delivery-based proformas are usually created by the **Global Trades and Services (GTS)** module of SAP.

After **billing document creation** with successful posting to accounting, invoice outputs are generated (for example, as Electronic Data Interchange (EDI) or paper) and transmitted to the customer.

basis on the first working day of the month. Finance will make a manual accrual if the value of shipped not billed items exceeds country specific materiality thresholds.

Methods of Creating Billing Documents

Billing Documents can be created based on these SD documents:

- With reference to a sales order
- With reference to a delivery

Billing Documents can be created by:

- Creating a billing document individually (VF01)
- Having the system process a billing due list automatically as a background job

The four main forms of processing in the Manage Billing process are:

- **Create** - a separate billing document is created per sales order or delivery
- **Combine** - several orders or deliveries are combined into a collective billing document based on a customer's calendar as necessary – see next page for more information on combining, or consolidating, a customer's invoices.
- **Split** - many invoices are created per sales order or delivery, known as invoice splits, with these elements:
 - Sales orders and deliveries automatically split into multiple invoices where key data differs between the lines.
 - Examples of key data are Customer PO Number, INCO Terms, Sales area, Billing Type, Billing Date, Payer, Payment Terms, Price Group, Customer Group, and Condition Group.

Manage Billing – Combining and Splitting

Shipped not Billed controls are performed on a monthly

Billing Management

Consolidate - this process consolidates the billing for a customer to bypass Customer PO and Ship-To split rule. For customers to run consolidated billing, two things need to be maintained:

- Customer needs to be set up on Consolidated Invoice table
- Each consolidated customer should have its calendar set up in the customer master record. The options are to consolidate on the following schedules and the terms start from the date of the invoice create:
 - Daily
 - Weekly and End of Month
 - End of Month
- Consolidated billing will run in batches according to the schedule and generate output based on the above two settings.

Manage Proforma Billing

A **proforma invoice** is a simulated invoice which is often created on paper for exported goods to provide the customs authorities with evidence of the cost of the goods.

The features of a proforma invoice include:

- It is used to give the details about forthcoming shipments to the importer or the responsible authorities in the import country
- It displays exactly the same as a customer invoice and can also be used as a prorated invoice, if needed
- It is not a copy of an actual invoice but a dummy billing document that is created prior to the real invoice
- It is not a true billing document, and thus not submitted for accounting

Processing a proforma invoice differs from processing a

normal invoice in the following ways:

- Goods issue is not required before a delivery related proforma invoice is created
- You can create as many proforma invoices as needed for a sales order or a delivery since the billing status in the sales order or delivery is not updated
- Proforma is a simulated billing document; it could have pricing, but that pricing may not be the same as the final invoice if it is created before billing occurs
- A proforma invoice doesn't generate any postings to the Financial Accounting System
- A proforma invoice does not need to be paid

This diagram illustrates proforma invoice generation from a sales order or delivery:

Generate SAP Billing Reports

Use the following search criteria to generate this report:

- Message Data: Output type, Transmission Medium, Sort Order, and Processing Mode
- Billing Data: Billing Document, Billing Date, Document Type, Sales Area Data, Sold-to Party, Payer, and Destination Country

Intercompany Billing

The Intercompany settlement process begins after a service is completed or products are shipped from the Source of Supply (SOS). A billing invoice is generated to the Purchasing Subsidiary (PUSB) for processing. Once the AP invoice is posted and processed for payment, settlement is completed in Accounts Receivable (AR).

Intercompany Payables

The steps include:

1. Receive Intercompany PO and non-PO invoices through various methods including IDoc, system generated, and paper.
2. Match PO invoices to goods received or confirmation of services.
3. Approve non-PO invoices in the Vendor Invoice Management (VIM) workflow.
4. Release invoices for payments

Ajustments and Returns

The process of managing adjustments and returns starts with the requirement to create a return, generate a credit or debit, invoice correction or cancellation based on a customer's request or deduction in Accounts Receivables (AR). [Salesforce integrations exist for adjustments and returns, which are covered in a separate training.](#) The adjustment process is completed with a billing document in terms of credit or debit, the communication of the invoice to the customer, where required, and its posting in the Financial Accounting System.

Adjustment and Returns Process

[Customer complains about a price error, damaged products, and short shipments:](#)

- Does not involve the processing of physical goods
- Credit memo can be generated to a customer to provide the respective credit amount.
- Credit (ZCR) or Debit (ZDR) Memo process is used
- Most locations will use the Customer Feedback Resolutions (CFR) system to document the complaint

[Return of goods is involved that can be referenced to a previous order:](#)

- This order type creates an inbound delivery in SAP.
- Automatically adjusts inventory and the cost of goods sold.
- The Return Order (ZRE) process is used

[Return of material with no financial adjustment:](#)

- Occurs due to an over shipment, return of a sample order, or free goods
- May be necessary to reimburse the relevant department code where sample order or free goods are returned
- A return is processed without creating a credit memo

In some regions, all material returns are handled by an external return processing company.

Third party returns or intercompany returns are processed by issuing a credit memo to the end customer upon return of goods to the vendor or source of supply.

Returns Processing

A return order is a sales document that is generally initiated by a customer request and is used to drive the returns process.

A return order:

- Is processed only in the event of physical return of the product.
- Creates an inbound delivery in SAP that automatically adjusts inventory and reverses the Cost of Goods Sold posting that is created when the product is originally sold.

Process Flow for a Standard Return, where a customer is responsible for the freight expense when returning product:

A product can be returned for various reasons. However, depending on the type of return, there is a difference in the treatment of the returned product. For example, if the returned product is a chargeable item, SAP generates a credit memo. In contrast, if the returned product is a sample or a free of charge item, no credit memo is issued to the customer. A return order can be created in the system for various reasons, such as:

A return document can be created in several ways:

Credit and Debit Processing

Credit memo requests are generated to adjust a customer's account or refund money back to a customer. Debit memo requests are generated to bill a customer for an additional amount and to claim any additional charges. A credit memo or debit memo can be created as a stand-alone document or it can be created with reference to the original invoice, copying the original prices and quantities. When a credit memo or debit memo is created without reference, the current Exchange Rate is used in the sales document. In both cases (created with or without reference), it is possible to update the exchange rate on the Header Sales tab, if needed.

Onboarding plan

SALESFORCE OVERVIEW

SALESFORCE OVERVIEW

Salesforce: a solution for Customer Relationship Management.

Most sales teams are challenged with managing inbound leads, logging activities, and follow-up. The leads object in Salesforce allows Sales Managers to assign Inbound leads from websites through leads assignment rules. The activities object allows for the reporting of tasks such as outbound calls, and ad events, such as in-person meetings. Lastly, reports can be created to display closing rates and the average length of sale cycles. Lastly, reports can be created to display closing.

Salesforce is a cloud-based software company. It also provides a contribution for enterprise applications that are focused on Marketing, automation, and analytics. It is a software-as-a-service company. 3M uses Salesforce. It is the most important tool that supports sales and Marketing across the world. It is the best tool to stay connected to partner customers and potential customers.

The product of Salesforce

Sales cloud: is a CRM platform that allows to manage the company sale, marketing and customer support aspect.

Marketing cloud: it helps to run campaigns, send E-mails and messages, and manage customer journeys, social media, content, and data analytics.

Analytics cloud: this allows to create highly useful Dashboards on the available data.

IoT Cloud: it can be used when the company needs to handle the Internet of Things, IoT Data. This platform has the ability to choose huge volume of data from devices. Following this, a real time response would be got.

App Cloud: we can use it to develop custom apps that will run on the Salesforce platform. The sales cloud and the developed tools can be used to develop the customer application.

Service Cloud: social networking login and case tracking operate here. It helps the company serve its marketing and sales team.

Salesforce provides excellent customer service from anywhere in the world.

It helps to solve customer problems faster. Salesforce allows you to unify E-Mail, social media, and phone and helps to manage every channel from one view. With the sale of tools, we can handle and customize every sale of data.

It helps also to track every analytics and to enhance customers' experience.

It allows flexible reports and data analysis.

User management

Following are the key points to remember while managing users:

- Users must be assigned an active license
- Usernames must be unique and in email format
- Reassign user licenses

Creating and customizing Tabs

The main points to remember in custom tabs:

- Tabs can be added or removed by individual users
- Web tabs can be added to access commonly requested sites
- Tabs can be created to display Visualforce pages

Creating an App in Salesforce

An App allows one to access common features, organize tabs in a logical manner, and create a customizable application. It is possible to create different apps for customer service team, sales team and marketing team. We can choose which tabs will be displayed in each app.

SALESFORCE OVERVIEW

SALESFORCE OVERVIEW

a product, price book, and Quotes in salesforce

Product

Products are the actual items that will be sold on our opportunities and quotes. Products are associated to have one or more price books. Products can exist in multiple price books with many different prices.

We can also create default revenue and/or quantity schedules for products or [opportunity line items](#). By creating default revenue or quantity schedules, we can determine how default unit prices are handled.

Price Book

we can use the [standard price book](#) or we can [create custom price books](#)

The standard [price book](#) is automatically generated which contains a master list of all products and standard prices regardless of the custom price books that also contain them. Before adding products to [our opportunities or quotes](#), first, we have to select the price book. When [importing products](#) you must also import price book entries. When using custom price books, we must add the product to the standard price book along with the custom price book.

Quote

A quote is [a formal proposal](#) for products and services that you are offering for a specific opportunity.

- Opportunities can contain multiple quotes and quotes are created from an opportunity and its products.
- In Salesforce.com, any change to line items on the opportunity will sync with products on the quote, when a quote and an opportunity are synced and vice versa.

You can also create templates that allow you to email completed quotes as PDFs to prospects.

Creating leads

In Salesforce sales cloud is very useful for the sales and marketing team in an organization. When a person enters to a database to purchase some products then we enter this person as a lead.

In an organization when a customer call, we have to enter his/her information detail, so that he became a lead. These information details will be used in future to contact that person. So we have to create a new lead in this process. To create a new lead, we have to go to Lead TAB and Select new, Enter all the Lead information, Enter Address information, Enter Additional

To view Lead go to Lead Tab=>Recent Leads, and select the lead which we created to view/edit.

Converting leads

Converting a lead to opportunity takes place only when a lead is qualified in an organization then we convert that lead to an account, lead to contact and lead to opportunity. When a lead is converted to opportunity it appears on [forecasting reports](#) in salesforce. To convert a lead to opportunity in salesforce go to Lead Tab, Click convert, Enter the name for the opportunity, Enter the subject name, priority and select status and then select Convert. After converting a lead to opportunity Account is automatically created with company name as account name and Account will be created with the first and last name of the lead in the contact name field.

creating accounts

Accounts in Salesforce are used to track customers. For every customer of a company an account will be created. In that account, we have opportunities, tasks, and contracts are linked to that account. Accounts are typically business

which have field about the organization. We can create accounts clicking Account Tab or importing Accounts and contacts from spreadsheets by selecting import my accounts and contacts. After selecting new we are taken to new page where we are required to enter Account information, address information and Additional Information to create new account. Account name is important and required field it must be entered. To merge duplicate accounts in salesforce go to Accounts tab and select [Merge Accounts](#) button and enter all the details like duplicate account name, master account. We can merge only 3 records at a time.

SALEFORCE OVERVIEW

SALEFORCE OVERVIEW

Creating new Contact in Salesforce

Contact records are used for individuals to store personal and business information. In contacts, we can store phone numbers, E-mail addresses. Department name, Fax etc. Last name field is required when creating a new contact in Salesforce. Both Contacts and accounts have a relationship with each other. Contacts are typically associated with an account. An [account](#) will have more than [one contact](#). To create a new contact in salesforce go to Contacts Tab. After selecting Contacts Tab select new as shown below. Now we are required to enter contact information, Address information, Additional information and description information while creating new contact in salesforce. Enter the First name, Last name, name of the account for contact and finally and save it. Contact details will be displayed in a detailed view. If we want to change contact details in salesforce select request update.

create a new E-mail Template

In salesforce, we can create four types of email templates.

1. [Plain Text e-mail template](#): - Plain text e-mail templates supports all e-mail clients and it does not support colored text and graphics in them.
2. [HTML with letterhead](#): - HTML with a letterhead format email templates supports all fonts, images and here we use a standard letterhead.
3. [Visualforce Template](#): - These types of email templates are created with apex code.
4. [Custom \(without using Letterhead\)](#): - Custom email templates support all HTML and this format will not have letterhead.

When creating approval steps in salesforce we require email template to be assigned to the users to which an e-mail is sent automatically by the salesforce system. We

create an e-mail template to notify the users through an e-mail.

Sending mass Emails in Salesforce

[Mass Email](#) in Salesforce is not designed to be an email marketing solution. In email distribution lists, we have contacts, leads, accounts, or users that are accessible to your user onsalesforce.com. Using this feature we can send mass emails in salesforce up to a maximum of 1,000 external email addresses per day and the number of external email addresses in your list is dependent on our Salesforce edition. We can send unlimited mass emails to internal users on Salesforce.com. Before sending Mass Email in Salesforce check the following points.

- For use with mass emails, we have to create email templates using plain text or HTML (with and without letterheads) which includes record-specific data via merge fields, graphics, and attachments.
- Mass emails can be sent immediately or scheduled for delivery.

Users can view and cancel mass Emails they schedule by clicking Setup -> Email -> My Mass Emails.

Administrators can view and cancel mass emails scheduled by all users in the Organisation by clicking Setup -> Monitoring -> Mass Email.

Points to be noticed when sending Mass Email in Salesforce.

- The "from" email field is automatically generated with the sending user's email address and cannot be changed.
- Salesforce.com has some issues with whitelisting of mass emails that may cause your mail to in up in the recipient's spam folder.

Creating opportunities

Opportunities play a major role in an organization because they represent sales and potential sales. Opportunities may have quotes, proposals, and orders. Opportunities are past or pending sales for an account that you want to work and/or track. Opportunities play a major role in an organization because they represents [sales and potential sales](#).

Creating opportunity takes place when a customer contacts a salesperson for a product and is interested to purchase the product. Then salesperson creates an opportunity with Account information, address information, and additional information. This opportunity is linked to campaigns to increase the effectiveness of sales in a company. After saving the opportunity we are taken to a detailed view of the opportunity to observe the field as shown above. While creating an opportunities in the salesforce, we can include stage and probability fields to estimate the likelihood of completing a successful sales. The probability for various stages can be set by the administrator.

SALESFORCE OVERVIEW

SALESFORCE OVERVIEW

Create new campaigns in salesforce CRM

Marketing professionals or marketing team uses campaigns to collect and process the leads collected in salesforce. To track the number of leads, contacts and opportunities, we use campaign records. To create new campaigns in salesforce CRM user must have Marketing User's license and also must enable permissions on campaigns in their profiles.

To create campaigns we have to go to campaigns Tab, and select new campaign, a form will be opened with some campaign information. Now the page will be opened in detailed view. In Salesforce CRM, new campaigns will have two default member status values they are Sent and Responded. To set up those campaign member status values go to Advanced Tab. Multiple responded values can be created. When we have more than one responded values they are summed together to produce the calculated field total responses. Now we have to add multiple members to a campaign in salesforce. Multiple members can be added from manage members in campaign page. We can add multiple members from Manage members. Existing contacts and leads can be selected from Manage members and go to add members-Search. Use add members-Search to search members. Now a page will be opened add multiple members from lead or contact reports. We have to select the required lead check boxes and select Add with status as shown. In Add with status select responded value. A confirmation message will be displayed and now go back to campaign. In Campaign members section we can see list of member that we added to campaign.

Saleforce activities

Salesforce activities are of different types. They are scheduled calendars, events and tasks. Salesforce activities are

similar to the activities in Microsoft outlook and Google applications. Generally, activities in salesforce are used to [schedule events, invite people to a function, add certain task to an employee and so on](#). Mainly these activities are used to get things done without any failure.

Events and tasks are related to records like accounts, contacts, leads, opportunities, and cases. By using salesforce activities we can track all [the tasks and events that are scheduled or involved in acquiring, selling, and servicing customers](#).

A task is an activity in an organization that needs to be completed. A task may not have any specific period or time duration for completion.

An Event is generally a calendar activity which has a scheduled time, date, and duration.

In salesforce Log a call is an activity where important data from the customer is gathered by making a call to customers.

Send an Email is an activity in salesforce where we can send emails from salesforce and also from third parties like Microsoft Outlook and Gmail.

Generating quotes in salesforce

Generating Quotes in Salesforce allows us to collect information [from products and price books](#) which are collected in to opportunities. Generating quotes in salesforce are done [only in PDF format and sending the PDF quotes through email to a customer](#). Before generating quotes in salesforce we have to create a Quote Template in salesforce. After creating a quote template in salesforce only we have to generate quotes. Quotes are created for only opportunities in salesforce to generate quotes for opportunities go to Opportunity Tab and select the opportunity record.

Create a Case in Salesforce

Cases are the foundation of the Service Cloud and are used to [track customer issues and inquiries](#). Cases are typically used to [track and manage customer feedback, issues, or questions](#). Cases can be created by support representatives, from web forms on your website (web-to-case), by customers themselves from the Customer Portal or directly from emails (email-to-case).

New cases can be assigned directly to support agents, case teams or case queues using assignment rules. Cases allow you to interact with customer easily [by sending and receiving email in one centralized location, replying with knowledge articles or solutions and managing entitlements more efficiently](#).

Web to Case forms can also be created to gather customers requests directly from the company or organization website. Web to Case forms are similar to Web to lead Forms. By using web to case forms we can generate 50,000 cases per day automatically. To create a case in salesforce, we have to follow the steps:

- go to cases.
- click on New Button.
- enter the contact name, Account name, Status, Priority, Case origin, Subject and description for a case.
- click on Save or Save and close, Save and New, Check Spelling and Close.
- Click on cancel button, to cancel the created case.

SALESFORCE OVERVIEW

SALESFORCE OVERVIEW

Web to case forms are used to gather customers requests directly from company or organization website. [Web to Case forms](#) is similar to [Web to lead Forms](#). By using web-to-case forms we can generate 50,000 cases per day automatically.

When the Web to Case form is submitted, salesforce.com runs field validation rules before creating any record. Rich text Area fields are not used in web to case forms because Rich Text Area fields are not supported by salesforce.com for web to case forms.

Create lead assignment rule in salesforce

Before creating lead assignment rules in salesforce we have to know what is the need for creating lead assignments in salesforce. Suppose if a company generates a huge amount of leads, managing that large pool of leads in an organization is very difficult. Generated leads in an organization must be assigned to the right users to distribute the workload. To minimize the workload leads are assigned to users by using assignment rules.

The lead assignment rule is a feature in salesforce which allows the administrators to define who should receive a lead with conditions. Example :- Depending on the country Zip code we can assign the leads to the users who assigned to that Country. Generally [sales manager](#) uses lead assignment rules to assign new leads to the users in an organization like [sales representatives](#) automatically.

Escalation Rules in Salesforce

Orgs commonly utilize one escalation rule that comprises various lead passages. For instance, the standard case escalation control could have two passages: cases with Type set to Gold are escalated within a two hours time frame, and cases with Type set to Silver are escalated within an eight hours time frame.

3M Innovation Center – Washington, DC

PRODUCTION PLANNING

PRODUCTION PLANNING OVERVIEW

ERP delivers all elements of the customer-oriented production management system and is fully compatible with **just-in-time (JIT)** and **Kanban methodology**. SAP integrates the **supply chain** to make your company competitive as possible. The production order is the main central data object in shop floor control and manufacturing execution process. A normal production order will cover the demand for a single material or product, but you can also produce multiple products jointly in one production order (co-products) and distribute incurred costs between the different products.

Production Planning is the process of aligning forecasts with the manufacturing capability to create production and procurement schedules for finished products and component materials. It also tracks and records the detail of the manufacturing process, for example, the planned and actual costs and material flows. It is fully integrated with the other SAP modules: **SD, MM, LE, QM, and CO**.

Every step of the production process is forecasted, along

with possible hurdles that may be encountered. The problems which may be encountered are tried to be removed with the help of proper planning.

Handling a few production orders in spreadsheets works but for large manufacturing shops, the complexity increases a lot. Production planning helps to plan the procurement of raw materials based on the quantity of finished products to be manufactured. It also affects **inventory, cash flow, sales, and distribution**.

KPIs for production planning

A few key performance indicators to track in production planning are:

- **Production cost**: This is essentially the monetary cost involved in producing the item. Costs include raw materials, electricity, fuel, worker salaries, rent, etc.
- **Capacity utilization rate**: It's the percentage of actual manufacturing output against the total possible manufacturing output. If many machines and workers are sitting idle, your capacity utilization is low. Ideally, you want it high but never full.
- **Projected versus actual hours**
- **Employee utilization (productivity)**
- **Takt time**: Takt time is a lean manufacturing concept. It is the time taken to produce a single unit of item.

Types of production planning

- Batch

When items are manufactured in batches with unique batch numbers allotted to each batch. Production planning in batches helps run machinery in a well-planned manner as the next step is planned and the machines are allocated accordingly.

- Job

This type of production planning is common in job shops

where custom material processing requirements are carried out. Each production plan will most likely be different from the last with the use of different materials, machinery, and operations on the materials.

- Flow

In the flow method, materials are processed smoothly from one machine to the next with very little human intervention. Any waiting time or bottlenecks are removed so that the materials 'flow' continuously till they become finished goods. Standardized work and quality control are essential to ensure consistent quality when producing items with the flow method.

PRODUCTION PLANNING

Steps in Production planning

The steps involved in production planning are:

- **Planning:** This involves planning shop floor resources to deliver finished goods on time.
- **Routing:** The exact route/path or set of operations the materials go through is known as a routing. Finding optimum routes that reduce wastage and promote continuous flow is a part of production planning. Finding better routings is about using workstations, machines, and workers in different orders without affecting the product to deliver the items faster.
- **Scheduling:** The machines, activities, and workers are scheduled to do tasks that are a part of the production plan. Scheduling well helps in delivering the finished products on time.
- **Loading:** Loading here refers to overloading the production line to see how much it can handle. By loading each point, the last bits of efficiency can be squeezed to get the maximum value.

Step in Production control

The steps involved in production control are:

- **Dispatching:** After the production plan is ready it's time to implement it by dispatching items in and out of the production line. Different operations and the corresponding workstations are managed to dispatch items to them. The time to complete each activity or 'job' is recorded.
- **Followup:** After issuing a plan, bottlenecks and other problems may arise. Follow-ups are done by supervisors to eliminate any bottlenecks and ensure that things are going according to plan.
- **Inspection:** Routine inspections are done during production to verify that the materials are being processed correctly. Note that this is different from quality inspections which are done after the product is finished.

- **Correction:** The results from other steps in production control are reviewed and corrections are made where necessary. This includes the routings, scheduling work, and even conversations with workers who are taking those long breaks.

Design Brings the 3M Experience to Life

DEMAND AND SUPPLY PLANNING

DEMAND AND SUPPLY PLANNING OVERVIEW

Demand Planning in LEX

Demand planning aids in forecasting customer demand while supply planning manages inventory to meet targets of the forecasted customer demand. This means demand planning is meant to guide supply chain operations, while supply planning relies heavily on demand forecasts.

Demand planners take into account a larger amount of data from multiple sources, such as past sales data to distributors and retailers. This data can be created into both constrained and unconstrained demand forecasting, which shows the maximum demand potential with and without limitations in cash flow and production capability.

By better planning purchases, a business will ensure inventory stock levels are where they need to be. The goal is to increase inventory turns and fill rates.

Supply Planning Process in SCM

Supply planning is used to fulfill the demand plan while meeting the benchmarks of the organization, as it relates to inventory production and logistics. In short, it tries to meet the demand forecasts as efficiently as possible. Supply planning has a bigger focus on manufacturing lead times, minimum order quantities, leveling production, and managing safety stocks.

A supply plan can only work with a demand plan in place. This is because a supply plan will input the demand plan and all component data, which generates a master production schedule. Once in place, the supply planning

reviews capacity and its impact on resources—making revisions as needed along the way.

Supply planning is just a cog in the sales and operations planning (S&OP) wheel. A supply chain planning system will help create needed forecasts, determine inventory to support the forecasts, determine the time to acquire this inventory, and figure out which factories are capable of completing these plans, before finally scheduling the work.

Sales and Operation in SCM

Sales and Operations Planning, or S&OP, integrates your supply chain planning processes to create a unified business plan surrounding supply chain demand. This information is usually pulled from data-heavy fields of your business, such as sales and marketing or manufacturing and distribution. Together, this data is used to improve inventory planning (or in other words, demand planning and supply planning).

By analyzing change history, annotations, and assumptions, S&OP can help businesses make the final decision on adding products, changing your manufacturing process, or altering how you run your deliveries or overall distribution. In short, many consider sales and operations planning to be the one such process that can help align supply with demand. This is because the outcome of an S&OP process is a consensus-based operating plan that helps a company create supply against the expected demand of their products.

Demand planning and supply planning go hand in hand by following a process (or flowchart) of sorts that also brings in the company finances and sales. This helps create

forecasts, determine necessary inventory levels, and determine the time and locations needed to complete these purchasing and production plans.

LOGISTICS EXECUTION

Logistics Execution is the link between procurement and distribution, regardless of whether the processes involved are internal or related to third-parties (vendors, customers, or service providers). **Inbound delivery** connects the procurement process with warehouse management process to facilitate putaway and good receipt. Warehouse management process is integrated with production processes which facilitates both staging of the raw materials required for production and receipts from production. Again **outbound delivery** links the sales and distribution process with warehouse management to execute picking, packing and shipping of products to customers and distribution centers.

Process Mapping with LEX

In Logistics Execution (more specifically from WM perspective), goods receipt and goods issue processes are basically mapped in two ways.

1. Without Delivery (simple process mapping)

In this approach good receipts or goods issues are posted against a purchase order or sales order respectively. Though it looks simple and efficient approach from a system transactions perspective, in real time business world it makes the logistics operation more manual and inefficient because it does not provide an option in the system to manage and

record real time activities between ordering and stock postings.

For example, in case of procurement, it is quite important and advantageous to know the real time details such as when (dates), what (material, batch, quantity), and how (packaging information, means of transport etc.) from the supplier well before shipments are received at the warehouse. This information provides an opportunity to plan logistics with forwarding & clearing agents, transport planners, and also to plan resources for internal warehouse operations.

Delivery document acts as an intermediate document between purchase order and goods receipt and facilitates the information regarding the activities between purchase order and goods receipt.

2. With Delivery (comprehensive process mapping)

In this approach an additional intermediate document, Delivery, is created against the purchase order / sales order. Subsequent goods receipt / goods issue is then posted against the delivery document. Delivery document is equipped with the functionalities to capture details and statuses of packing, picking/putaway, goods receipts/issues and transportation etc.

SUMMARY

I can not write in detail all about my work experience due to my Non-Disclosure Agreement. It is why this report seems simplified but I will say this job was a huge learning experience for me. My training period was quite an important step that allowed me to understand in detail all the different activities within the company. In a short time, I had to familiarize myself with the different work tools (SAP, salesforce, Microsoft office, Teams...).

I was able to learn so much in such a short time because I was thrown into several small teams that gave me first-hand experience of how they worked. The interactions carried out with the different production, marketing and supply chain teams allowed me to better understand the interactions between the different teams.

I didn't expect to learn so much in this job. My understanding of how a business works and the interdependence of different departments fascinated me.

I was able to understand in my department that good customer management and the resolution of the various issues related to its satisfaction is a key element for the success and prosperity of each company.

I also learned a lot from interacting with different teammates and improving my performance in various fields. I could not finish without highlighting the support of my teammates and their constant effort so that I can finally achieve my work objectives.

All in all, I'm really grateful to have had the opportunity to learn a variety of skills and meet some ingenious people along this professional adventure. I look forward to starting a new work experience as well as continuing to work towards my various professional goals.
